

ABSTRACT OF THE DISCLOSURE

0024 This document will describe and relate a new, improved, and innovative “virtual” all-inclusive system/process of total connectivity. This connectivity can be achieved under the umbrella of my invention titled Internal Cavity System (ICSS). The object here is to improve/combine these components—as well as creating new products to enhance ICSS’s development—into a single engine in which users will be able to make the most efficient use of their time.

0025 An example of ICSS would be for an individual to phone his/her residence (or into the main controls of ICSS) and give commands to an appliance. This is an example of what will become the future “Common Civilian Usage (CCU)” of this system. Another such usage would allow pilots of an in-flight aircraft to maintain real-time audio/visual contact of any/all parts of the craft as well as authorized ground crews having this same access. ICSS would also allow industries such as these to be able to capture, store, and retrieve data collected for any/all strategic reasons.
